

coreboot - Bug #129

KGPE-D16 fails to boot

07/14/2017 04:53 AM - Timothy Pearson

Status:	New	Start date:	07/14/2017
Priority:	Normal	Due date:	
Assignee:	Timothy Pearson	% Done:	0%
Category:	board support	Estimated time:	5.00 hours
Target version:			
Description			
Somewhere between GIT hash 0f3a18ad28b3d44e57806e5d77f15f04acd05543 and GIT hash a04aa3d5662149b70f31e0e6584bd8c6087b5f3b, the KGPE-D16 boot broke. GIT hash a04aa3d5662149b70f31e0e6584bd8c6087b5f3b doesn't appear to function at a bootblock level; no POST codes are displayed and no serial output appears. I have not yet completed a bisect between these revisions; volunteers are welcome!			

History

#1 - 07/27/2017 06:22 PM - Paul Menzel

From user tpearson in [#coreboot@irc.freenode.net](#):

Normally I'd say yes, but in the past couple of weeks I saw the exact same behaviour on a second board under manual test -- no logs of any kind, no POST codes, apparent hang in or around bootblock that particular failure comes and goes randomly with coreboot revision

#2 - 08/16/2017 11:50 AM - Iru Cai

I can boot to Linux payload with commit 588c2c42c3609785e3856f76bab884ff563b40ca. Is it fixed now?
